Intro to Problems 1 and 2

EDIT SETTINGS COPY PASTE DELETE

Problems 1 and 2 assess your knowledge/ability in computing probabilities related to the normal (Gaussian, Z) distribution. Like much of the work in BEM1105x, you are free to work out your answers using computational software (e.g., Excel). If you don't have access to statistical software, you can also use online statistical calculators, e.g., <http://stattrek.com/online-calculator/normal.aspx>

Problems 1 and 2

EDIT SETTINGS COPY PASTE DELETE

Problems 1 and 2

0.0/20.0 points (ungraded)

Let X be a normal random variable with mean equal to one and variance equal to four. Using statistical software if needed, answer the following two questions:

Enter the probability that X is no more than one, $P(X \leq 1)$:

Enter the probability that X is no less than minus two, $P(X \geq -2)$:

Problem 3  [View Live Version](#)[Preview](#)

⚠ Caution: The last published version of this unit is live. By publishing changes you will change the student experience.

Intro to Problem 3

 EDIT    

Problems 3 assesses your knowledge/ability in computing probabilities related to functions of the standard normal random variable.

Problem 3

 EDIT    

Problem 3

0.0/10.0 points (ungraded)

Let $N(x) = P(Z \leq x)$ denote the probability that a standard normal random variable Z is no more than x . Consider the probability

$$P\left(ae^{bZ+c} \geq d\right).$$

Here, a, b, c, d are positive constants and e^x is the exponential function.

What is the expression for that probability in terms of function $N(x)$?

$N\left(\frac{\log(d)-\log(a)-c}{b}\right)$

$N\left(\frac{c-\log(d)+\log(a)}{b}\right)$

$N\left(\frac{d}{a}\right)$

$N\left(\log(d) - a \exp bZ + c\right)$

[Problem 3](#)

Intro to Problem 10 EDIT

Problem 10 assess your knowledge/skills in computing the total (or full) derivative of a function with respect to a given variable. (This is probably the hardest problem of the ten.)

Problem 10 EDIT

Problem 10

0.0/10.0 points (ungraded)

Let $y(x)$ be a function of x , and $f(x, y)$ a function of two variables. Denote the derivative of $y(x)$ with respect to x by y_x , the derivative of f with respect to the first variable, and evaluated at the point $(x, y(x))$, by f_x , and the derivative of f with respect to the second variable, and evaluated at the point $(x, y(x))$, by f_y .

Write, in terms of only y_x , f_x and f_y , the (total) derivative of the function $g(x) = f(x, y(x))$ with respect to x . Explicitly indicate multiplication with a "*" symbol, and write the derivatives as y_x, f_x, f_y .
